Causality Interfaces and Compositional Causality Analysis

Edward A. Lee Haiyang Zheng Ye Zhou

{eal, hyzheng, zhouye}@eecs.berkeley.edu Center for Hybrid and Embedded Software Systems (CHESS) Department of Electrical Engineering and Computer Sciences University of California at Berkeley

Workshop on Foundations of Interface Technologies Satellite to CONCUR 2005

- Focus on concurrent software components:
 - "actors", which are in charge of their actions \checkmark
 - "objects", which are acted upon
- Develop *causality interfaces* for actors in actor-oriented design and an *algebra* for composing these interfaces.
- Deploy causality interfaces to determine existence and uniqueness of behaviors of compositions of actors under certain *models of computation*.

Actor-Oriented Design

Actor-Oriented Design

Causality

• The Tagged Signal Model

Composition of Actors

3 Causality Interfaces

- Definitions
- Compositional Analysis
- Dynamic Causality Interfaces

Offers complementary approaches (to object-oriented design) for modeling compositions of concurrent components.

Object orientation:

what flows through an object is sequential control.

Actor orientation:

what flow through an actor are streams of data.

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

The patterns of interactions between concurrent components are called *models of computation*.

- Classical "actor model" [Agha, 1990][Hewitt, 1977]
- Synchronous languages [Benveniste, Berry, 1991]
- Discrete event models [Cassandras, 1993]
- Dataflow models
 - Kahn-MacQueen process networks [Kahn, MacQueen, 1977]
 - Dennis-style dataflow [Dennis, 1974]

Analogous to the type signatures of an abstract data type in object-oriented design:

Static structure interface:

- ports
- parameters
- their type constraints

Richer Interfaces for Actors

- Interaction semantics [Talcott, 1996]
- Behavioral subtyping [Liskov, Wing, 1999]
- Interface theories [de Alfaro, Henzinger, 2001]
- Behavioral type systems [Lee, Xiong, 2004]
- Abstract behavioral types [Arbab, 2005]

Note

These interface theories cover behavioral properties, not just static structure.

FIT 2005 8 / 34

- A special family of behavioral interfaces that capture the causality properties of actors, which reflect the dependency of particular outputs having on particular inputs.
- Useful for determining existence and uniqueness of behaviors of compositions under certain models of computation.
- Related to causalities properties of stream functions in [Broy, 1995]

1) Actor-Oriented Design

2 Causality

- The Tagged Signal Model
- Composition of Actors

3 Causality Interfaces

- Definitions
- Compositional Analysis
- Dynamic Causality Interfaces

- We use a formal and *denotational* framework for studying and comparing actor-oriented models of computation, which is called the Tagged Signal Model [Lee, Sangiovanni-Vincentelli, 1998].
- Related to
 - Interaction semantics [Talcott, 1996]
 - Behavioral types [Arbab, 2005]

Event *e*: (t, v) pair, where $t \in T$ and $v \in V$. *T* is a partially or totally ordered set. *V* is a set of possible values.

 $e \in \mathcal{E} = \mathcal{T} \times \mathcal{V}$, where $\mathcal{E} :=$ the set of all events.

Signal *s*: a set of events For example, a token stream of infinite length

 $s \subset \mathcal{E}, \ S :=$ the set of all signals. $s \in S = \mathcal{P}(\mathcal{E})$, the power set.

FIT 2005 13 / 34

An actor operates on signals. Behavior σ : a total function from ports to signals Actor *a*: a set of behaviors

$$\sigma \colon P \to S, \ a \subset [P_a \to S].$$

Lee, Zheng, Zhou

FIT 2005 14 / 34

H 5

Functional actor:

- has input ports P_i and output ports P_o
- defines a function from input behaviors to output behaviors

$$F_a: [P_i \rightarrow S] \rightarrow [P_o \rightarrow S].$$

< 🗇 🕨

Actors are composed by connecting ports with connectors.

Lee, Zheng, Zhou

Causality Interfaces and Compositional Causality Analysis

FIT 2005 16 / 34

Composition of Actors

A connector c between ports P_c is the constraint on ports. It is also a set of behaviors.

$$egin{aligned} m{c} \subset [m{P_c} o m{S}] \ orall \sigma \in m{c}, \exists m{s} \in m{S} \ m{s.t.} \ orall \ m{p} \in m{P_c}, \ \sigma(m{p}) = m{s} \end{aligned}$$

Lee, Zheng, Zhou

FIT 2005 17 / 34

A *composition behavior* is the intersection of the actor and connector behaviors.

 $a \wedge b \wedge c = \{ \sigma \mid \sigma \downarrow_{P_a} \in a \text{ and } \sigma \downarrow_{P_b} \in b \text{ and } \sigma \downarrow_{P_c} \in c \}.$

FIT 2005 18 / 34

Example of Composition

- series composition
- parallel composition
- feedback composition

< 4 →

Feedback Composition

Causality Interfaces and Compositional Causality Analysis

▲ ■ ▶ ■ • • ○ < ○FIT 2005 20 / 34

Fixed Point Behavior

Recall that F_a denotes the behaviors of actor *a*:

$$F_a \colon [P_i \to S] \to [P_o \to S], \ P_i \cup P_o = P_a$$

The input behavior of the left feedback composition is a function:

f:
$$\{p1, p2, p3\}
ightarrow S$$
 .

The above behavior is a fixed point of F_a . That is,

$$F_a(f) = f$$
.

Questions about Fixed Point Behavior

$$F_a(f) = f$$

Problem (1)

Does such a fixed point f exist?

Problem (2)

Is the fixed point f unique?

Causality Interfaces and Compositional Causality Analysis

FIT 2005 22 / 34

Causality is the Key

- Synchronous Languages No causality loop.
- Discrete-Event Models Contraction map.
- Dataflow Models No deadlock.

The key is to determine the causality properties of actor *a* from the causality properties of its components, the actors and connectors contained inside.

FIT 2005 23 / 34

Actor-Oriented Design

2 Causalit

- The Tagged Signal Model
- Composition of Actors

Causality Interfaces

- Definitions
- Compositional Analysis
- Dynamic Causality Interfaces

Causality Interfaces

- *D* is an ordered set with elements called *dependencies*.
- A causality interface for an actor a with input ports P_i and output ports P_o is a function

$$\delta_a: P_i \times P_o \to D$$

 A causality interface for a connector c that links output ports P_o to input ports P_i is a function

$$\delta_{c} \colon P_{o} \times P_{i} \to D$$

Dependency Set D as an Algebra

D is an ordered set with two binary operations \otimes and \oplus that satisfy the axioms given below.

• (Associativity)

 $\begin{array}{ll} \forall d_1, d_2, d_3 \in D, & (d_1 \oplus d_2) \oplus d_3 = d_1 \oplus (d_2 \oplus d_3), \\ \forall d_1, d_2, d_3 \in D, & (d_1 \otimes d_2) \otimes d_3 = d_1 \otimes (d_2 \otimes d_3). \end{array}$

(Commutativity)

 $\begin{array}{ll} \forall d_1, d_2 \in D, & d_1 \oplus d_2 = d_2 \oplus d_1, \\ \forall d_1, d_2 \in D, & d_1 \otimes d_2 = d_2 \otimes d_1. \end{array}$

(Distributivity)

 $\forall d_1, d_2, d_3 \in D, \quad d_1 \otimes (d_2 \oplus d_3) = (d_1 \otimes d_2) \oplus (d_1 \otimes d_3).$

• (Null and Identity Elements) $\exists 0, 1 \in D$, such that $\forall d \in D$,

$$d \oplus \mathbf{0} = d, \quad d \oplus d = d, \\ d \otimes \mathbf{0} = \mathbf{0}, \quad d \otimes \mathbf{1} = d.$$

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Examples of Dependency Sets

Boolean Dependencies

- $D = \{$ true, false $\}$, where false < true, **0** = true, and **1** = false.
- \oplus is logical and, \otimes is logical or.

 $\delta(p_1, p_2) =$ false means that P_2 depends immediately on P_1 .

Weighted Dependencies ¹

- $D = \mathbb{R}_+ \cup \{\infty\}$, where < is as usual, $\mathbf{0} = \infty$, and $\mathbf{1} = \mathbf{0}$.
- \oplus is the *minimum* function, \otimes is addition.

 $\delta(p_1, p_2) = 0$ means that P_2 depends immediately on P_1 .

The \otimes identity, 1, means immediate dependency.

¹This set is also called a min-plus algebra [Baccelli, 1992].

Lee, Zheng, Zhou

Causality Interfaces and Compositional Causality Analysis

FIT 2005

27/34

Problem

Given a set of actors, a set of connectors, and their causality interfaces, determine the causality interface of their composition.

In the following example, we want to determine the function:

$$\delta_a: \{p1\} \times \{p4\} \rightarrow D.$$

A D M A A A M M

Solving the Example

Causalities interfaces of actors: $\delta_1(p1, p5) = \mathbf{1} \quad \delta_3(p7, p6) = \mathbf{1}$ $\delta_2(p3, p4) = \mathbf{1} \quad \delta_2(p2, p4) \neq \mathbf{1}$ Causalities interfaces of connectors:

$$\forall p \in P_o, \ p' \in P_i, \ P_i \cup P_o = P_c, \ \delta_c(p,p') = \mathbf{1}$$

Combine the interfaces of connectors and actors using the \otimes operator for *series* compositions and the \oplus operator for *parallel* compositions.

$$\delta_{a}(p1,p4) = \delta_{1}(p1,p5) \otimes (\delta_{c}(p5,p2) \otimes \delta_{2}(p2,p4) \\ \oplus \delta_{c}(p5,p7) \otimes \delta_{3}(p7,p6) \otimes \delta_{c}(p6,p3) \otimes \delta_{2}(p3,p4)) \\ = \mathbf{1}$$

Existence and Uniqueness of Behaviors

Problem

Given the causality properties of a composition of a set of actors and connectors, determine the existence and uniqueness of the behaviors of the composition.

A unique behavior exists if there exists no port that has an immediate dependency (\otimes identity, "1") on itself.

Lee, Zheng, Zhou

Causality Interfaces and Compositional Causality Analysis

FIT 2005 30 / 34

Application to Synchronous Languages

- Apply boolean dependencies, where 0 = true and 1 = false.
 Note that ⊕ is *logical and*, ⊗ is *logical or*.
- A unique behavior exists if there exists no port that has a dependency on itself with value "false".

$$\begin{split} \delta(p4,p4) &= \delta_c(p4,p1) \otimes \delta_a(p1,p5) \otimes \delta_c(p5,p2) \\ &\otimes (\delta_a(p2,p4) \oplus \delta_a(p2,p6) \otimes \delta_c(p6,p3) \otimes \delta_a(p3,p4)) \\ &= \mathsf{false} \otimes \mathsf{false} \otimes \mathsf{false} \otimes (\mathsf{true} \oplus \mathsf{false} \otimes \mathsf{false} \otimes \mathsf{false}) \\ &= \mathsf{false}. \end{split}$$

Application to Discrete-Event Models

- Apply weighted dependencies, where 0 = ∞ and 1 = 0.
 Note that ⊕ is the minimum function, and ⊗ is addition.
- A unique behavior exists if there exists no port that has a dependency on itself with value "0".

$$\begin{split} \delta(p4,p4) &= \delta_c(p4,p1) \otimes \delta_a(p1,p5) \otimes \delta_c(p5,p2) \\ &\otimes (\delta_a(p2,p4) \oplus \delta_a(p2,p6) \otimes \delta_c(p6,p3) \otimes \delta_a(p3,p4)) \\ &= 0 \otimes 0 \otimes 0 \otimes (2.0 \oplus 0 \otimes 0 \otimes 0) \\ &= 0. \end{split}$$

FIT 2005 32 / 34

• Causality interfaces of a modal mode may vary due to the change of its internal states. Let *X* denote the set of states, then the causality interfaces are given by a function

$$\delta' \colon \boldsymbol{P}_i \times \boldsymbol{P}_o \times \boldsymbol{X} \to \boldsymbol{D}$$
.

 A simple static and conservative analysis approach: for an input port p_i ∈ P_i and an output port p_o ∈ P_o of an actor,

$$\delta(\boldsymbol{p}_i, \boldsymbol{p}_o) = \bigoplus_{x \in X} \delta'(\boldsymbol{p}_i, \boldsymbol{p}_o, x) \; .$$

• This simple method may be too conservative in practice. A more precise static analysis may not be always available.

An interface theory for causality interfaces of actors and their composition.

 Applications to determining existence and uniqueness of behaviors for synchronous languages and discrete-event models.
